

Problem 5.3

a.) To use Newton's Second Law ($F=ma$), we need to determine the acceleration. Using kinematics to do so yields:

$$\begin{aligned} a_x &= \frac{\Delta v_x}{\Delta t} \\ &= \frac{(v_f - v_o)_x}{\Delta t} \\ &= \frac{((8.00 \text{ m/s}) - (3.00 \text{ m/s}))}{(8.00 \text{ s})} \\ &= .625 \text{ m/s}^2 \end{aligned} \quad \text{and} \quad \begin{aligned} a_y &= \frac{\Delta v_y}{\Delta t} \\ &= \frac{(v_f - v_o)_y}{\Delta t} \\ &= \frac{((10.0 \text{ m/s}) - (0 \text{ m/s}))}{(8.00 \text{ s})} \\ &= 1.25 \text{ m/s}^2 \end{aligned}$$

1.)

With the acceleration components, we can write the force components as:

$$\begin{aligned} F_x &= ma_x \\ &= (4.00 \text{ kg})(.625 \text{ m/s}^2) \\ &= 2.50 \text{ N} \end{aligned} \quad \text{and} \quad \begin{aligned} F_y &= ma_y \\ &= (4.00 \text{ kg})(1.25 \text{ m/s}^2) \\ &= 5.00 \text{ N} \end{aligned}$$

So the net force will be:

$$\begin{aligned} \vec{F} &= F_x \hat{i} + F_y \hat{j} \\ &= (2.50 \text{ N})\hat{i} + (5.00 \text{ N})\hat{j} \end{aligned}$$

b.) As for the magnitude of the force:

$$\begin{aligned} |\vec{F}| &= \sqrt{(F_x)^2 + (F_y)^2} \\ &= \sqrt{(2.50 \text{ N})^2 + (5.00 \text{ N})^2} \\ &= 5.59 \text{ N} \end{aligned}$$

2.)
